

# Orthopaedic Guidance Hub — Project Overview

## Introduction

The Orthopaedic Guidance Hub is an early-stage prototype digital tool developed with the PRUH orthopaedic team in mind to make orthopaedic guidance easier to find and use in day-to-day clinical practice. It provides a simple, mobile-friendly, searchable front door to relevant national and specialist-society guidance for use in ward, clinic, and on-call settings. This helps clinicians navigate guidance that is currently spread across multiple organisations, websites, and document types.

Fig 1: Guidelines library — grouped by clinical section, searchable, with source links and version tracking.

Fig 2: Guideline entry detail — source, summary, review status, and linked versions.

## What the prototype currently offers

The current version of the hub:

- groups guidance by relevant clinical section and topic
- allows quick browsing and search
- links directly to original source documents
- creates a more coherent and accessible navigation layer across multiple guidance providers

The tool is intended to help clinicians reach relevant guidance more efficiently, rather than replace the source material itself.

## Why it is useful

In busy clinical environments, guidance can be difficult to locate quickly despite already existing. A tool that improves access, visibility, and organisation has the potential to make day-to-day practice more efficient and more consistent, particularly for junior clinicians and teams working across different settings.

## Current position

The project is currently a first-draft prototype and has been shared locally for early feedback. The response so far has been encouraging, and the next step is to refine it into a stronger final draft while clarifying the appropriate governance, licensing, and maintenance arrangements needed before any wider rollout is considered.

Following this initial feedback, I have also been encouraged to explore what an app-based or more formal mobile version of the tool could look like in the future, once the core web-based model has been refined.

The project is being shaped to ensure any future expansion is supported by appropriate governance, licensing, and maintenance arrangements

## Next steps

The next stage of work is focused on:

- refining the prototype into a stronger final draft
- clarifying IP, licensing, and publication considerations
- defining a realistic maintenance and ownership model
- gathering more detailed feedback on what would make the tool most useful in practice
- exploring whether a mobile app or app-like version would be appropriate at a later stage

## About the project lead

Safa Saheer, a Biomedical Science student and the originator of the Orthopaedic Guidance Hub, developed as an early-stage digital project to improve access to orthopaedic guidance at PRUH
